1. Introduction

The latest financial and political upheaval in Greece leaves the domestic economy in a state of flux. The present situation shows the seeds for another recessionary year, featuring depressed consumption, cancellation of investment projects, weak exports and high unemployment. And, although the recent Euro Summit agreement on Greece and the subsequent termination of the banking holiday constitute steps in the right direction and put an end on the various GRexit scenaria, the negative ramifications of the recent turmoil may well persist for an extended period of time.¹

In this note we focus on the potential impact of capital controls on the real economy. In order to address this issue, first we define the shock and then we describe the propagation mechanism through which it impacts the economy.

2. Capital controls: basic characteristics

Domestic authorities imposed capital controls together with a short term banking holiday on June 28, 2015. During the banking holiday, the upper limit for cash withdrawals from bank ATMs was set at €60 per cash card. Transactions with cash cards or web-banking were allowed between domestic residents but not with residents abroad (for the majority of transactions).² The bank holiday ended on July 19, 2015, but capital controls remained in place and the Athens Stock Exchange remained closed. The imposition of capital controls can be seen as a twofold shock. First, it creates a number of distortions in transactions and second, it increases uncertainty, exerting a negative influence on economic sentiment.

3. How do households and firms respond?

In theory, choices of economic agents are determined by the combination of available possibilities and preferences. How do households and firms respond to a sudden change in their transactions possibilities, given their preferences between transactions with paper money and plastic money *e.g.* cash cards or web banking? To analyze the pure effect of the aforementioned change on agents' behavior we assume that expectations about the stability and the solvency of the domestic banking sector remain unchanged. In other words we isolate the "uncertainty or risk" effect of capital controls. Due to the restrictions on cash withdrawals, the *relative* cost of paper money transactions becomes very high.³ As a result, rational behavior dictates that most agents will turn to online and cash card transactions.

However, this adjustment is not without costs. It usually takes time for many households and firms to adjust their daily transaction habits (see Figure 1). In the case of Greece, this argument is reinforced by the following two facts: first, according to the digital economy and society index, DESI, (European Commission, 2015), Greece ranks 26th among all EU

¹ The GRexit, the exit of Greece from the euro area, has no potential benefits for the Greek economy. For details please refer to Monokroussos, Stamatou and Gogos (2015).

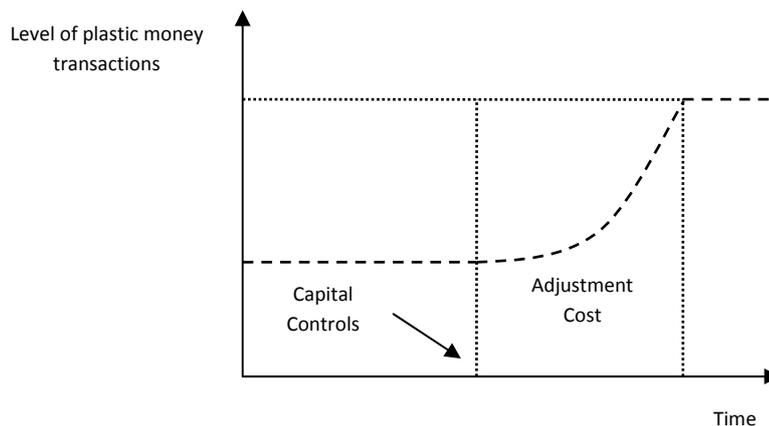

² In the Appendix we present a table with the detailed capital controls restrictions as of July 16th 2015.

³ For example, suppose you want to buy a good which costs €61. Furthermore, let us assume that the only way to make this purchase is with cash. Before the imposition of capital controls you had to consume t minutes of your spare time to go to the bank, make the respective withdraw and then buy the product. Today, in order to satisfy the same need you must spend $t + 24$ hours.

July 31, 2015

countries in terms of the tendency of individuals to use internet services. More specifically, 21 percent of Greek internet users engage in online banking activities (ranking: 26th) and 40 percent in online shopping (ranking: 21st). The relevant figures for the EU average are 57 percent and 63 percent, respectively. Second, the vast majority of Greek pensioners do not use plastic money. In fact, a high proportion of them do not even have a cash card. Hence, as long as tight capital controls remain in place the incentive for purchases of goods and services in sectors (e.g. retail trade) where paper money has been extensively used as means of payments will likely decrease.⁴ Consequently, transactions will slow down significantly and employment and incomes will shrink. The longer the adjustment period, the higher the cost for the economy.

Figure 1: The adjustment cost of a change in transactions possibilities

4. Foreign sector, supply side effects and investment

With regard to foreign trade, the near-term outlook is rather gloomy. The fact that cross-border financial transactions are now either forbidden or requiring the approval by a special Ministry of Finance committee (or by the respective bank, for certain types of transactions) translates into increased transaction costs for Greek importing and exporting companies. This, in turn, raises the prospect of certain shortages soon appearing in the market and/or of importers facing a running out of their stock. At the same time, exporters, especially in the manufacturing industry, may face a direct negative impact on their production, since they rely on imported raw materials or intermediate goods. Anecdotal evidence already suggests that there are shortages in imported goods in the retail sector and in raw materials in the export sector. Clearly, the aforementioned restrictions increase bureaucracy and transaction costs, with the net effect being a potential reduction in imports, price increases in the internal markets as well as decreases in domestic production levels and a further spike in the unemployment rate (25.6% in April 2015).

Increased market uncertainty as regards the potential macroeconomic ramifications of capital controls is also likely to impact investment activity, as potential investors may now require an additional risk premium in committing fresh capital to the domestic economy. As a result, the imposition of capital controls may cause a new deterioration in Greece's ranking in various world competitiveness indices, dealing a further blow to the extroversion profile that the country has been trying to build from 2010 onwards with limited results so far. For instance, Greece ranked 48th among 189 economies on the *Trading Across Borders* index of the World Bank's *Doing Business Indicator 2014*. We may see this ranking deteriorating this year and the next, especially if capital controls remain in place for an extended period of time.⁵

⁴ It is worth pointing out that just after the imposition of capital controls, there was a steep increase in the demand for consumption goods like pasta, rice, legumes, canned food products, oil, flour and milk. This phenomenon is mainly attributed to the creation of panic in consumers' psychology and it does not contradict our argument that the adjustment towards non paper transactions will be accompanied by a reduction in purchases of goods and services. In the transactions for the aforementioned products the "panic effect" has dominated the "transactions costs effect" and this caused an increase in demand. Nevertheless, we believe that this phenomenon will only be temporary.

⁵ The sample period of the *Doing Business Indicator* ends at the end-of-May or early June of every year. It is encouraging here that the imposition of capital controls will not affect the *Doing Business 2015* rankings. The Greek Authorities still have one year to regain the space lost by the imposition of capital controls by implementing structural reforms on other areas of the Greek economy.

5. Bad timing for the tourism industry

As regards the prospects of the Greek tourism industry, the timing of the imposition of capital controls vindicated the worst case scenario due to the fact that the peak of the tourism season for Greece is between May and September. According to BoG's balance-of-payments statistics, tourism receipts grew by ca 9.5% YoY in the first quarter of 2015, but heightened uncertainty over the successful completion of the 2nd Adjustment Programme appears to have lately had a negative impact on tourism revenues. On July 9, the Association of Greek Tourism Enterprises (SETE) estimated that the *immediate* impact of the imposition of capital controls was a 30 to 40 percent drop in flight bookings on an annual basis. At the time, the impact was expected to stabilize at around -20 percent in the short-term.⁶ However, the negative effect on tourism activity is expected to abate in the period ahead, not least because there is currently no limit on cash withdrawals from foreign accounts. Furthermore, the July 13th Euro Summit agreement on Greece and the prospective inceptions of negotiations with official creditors on a new bailout programme (after the Greek Parliament endorsed the required set of prior actions) are likely to facilitate the gradual return of domestic banking activity towards normality, albeit under capital controls for a *yet-unidentified* period of time. Notwithstanding this expected improvement, capital controls may have a series of indirect effects on the tourism industry due to, among others, existing restrictions on domestic payments to residents or companies abroad. For instance, payments relating to imports of goods necessary for the efficient operation of the tourism sector or other related services (airlines, travel agencies, etc.). According to SETE (June, 2015), last year the Greek tourism industry had a *direct* contribution to GDP of 9.5 percent, with its total contribution is estimated at between 20 and 25 percent. Consequently, a drop in tourism revenues this year is likely to have a not negligible (negative) impact on GDP growth and employment.

6. Uncertainty over the prospects of the Greek economy

Another factor that may negatively affect domestic consumption and investment is increased uncertainty over the prospects of the Greek economy. In that respect, the July 12 Euro Summit agreement should be considered as a good starting point for a gradual decrease in perceived Grexit risks, though there is still a difficult way towards reaching a final agreement on a new bailout programme.⁷ In our view, the timely finalization of such an agreement (by August 20 or a bit later than that) is of crucial importance for reducing heightened uncertainty still surrounding Greece's economic outlook. On the other hand, any major delays could reignite investor worries, not least because of the problematic liquidity position of the Greek State and the fluidity characterizing the domestic political scene. Looking further ahead, a sustained decline in uncertainty would be a function of, *inter alia*:

- the pace of implementing the structural requirements of the new programme;
- the achievement of the agreed fiscal targets;
- the return of the real economy into positive growth rates;
- the improvement of investor and depositors confidence about the stability of the domestic banking system; and
- the return of the Greek Sovereign to the international capital markets.

According to IMF (2015, 2012), capital controls is more effective when they are part of a broader policy package aiming to improve the macroeconomic and financial environment of a country. In Greece's case, the progress of removing investor uncertainty over the country's euro area membership prospects will determine, to a great extent, the speed by which authorities will relax existing restrictions in the free movement of capital.

Taking as an example the 2nd Adjustment Programme for Greece (February 2012) and using the 10-year GGB/Bund yield spread as proxy for investor perceptions about implementation success, it can be inferred that it took at least two years for a significant decrease in related uncertainty to materialize. Note that the said spread reached its lowest point in mid-June 2014 (Figure 2), after five successful EC/ECB/IMF Reviews. In fact, as a result of the progress made in the programme implementation, Greece managed to successfully tap financial markets twice in Q2 2014. In that respect, it is probably not by coincidence that it took two full years for Cyprus to entirely lift its capital controls (April 2015),

⁶ For more information (in Greek only) refer to: <http://sete.gr/el/kentro-typou/deltia-typou-anakoinoseis/press-repository/2015/diethneis-touristikes-afixeis-ianouarios-ioynios-2015/>

⁷ Eurogroup President J. Dijsselbloem said on July 13 that at least five weeks are needed for the various working groups to form the final text of the new programme for Greece.

following the successful conclusion of as many as four programme reviews and after successfully tapping the market once in June 2015.⁸

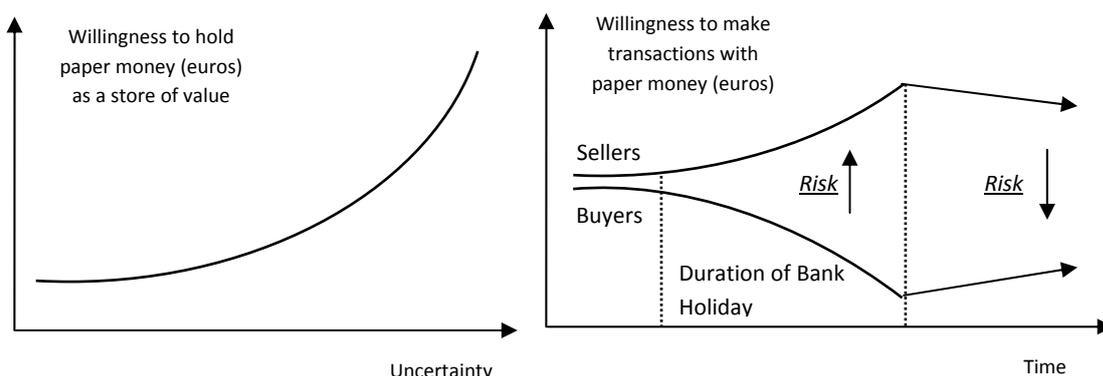

Figure 2: 10-year GGBs Spreads over Bunds

Source: Bloomberg.

In Greece’s case, another crucial question is how financial transactions will co-evolve with confidence towards the stability of the domestic banking system. According to BoG’s financial statement, the total amount of banknotes in circulation stood at €50.5bn (or 28% of GDP) in June 2015, recording a €5bn increase relative to the prior month. Furthermore, during the Bank Holiday the precautionary demand for paper money (Keynesian money demand function) skyrocketed. This type of behavior characterized both buyers and sellers. Indeed, there is plenty of anecdotal evidence suggesting that during that period small and medium size entrepreneurs were more willing to sell their products in exchange for cash than other means of payments (e.g. credit or debit cards). Hence, on the one hand buyers were less willing to pay with cash and on the other hand sellers were less willing to offer their goods in exchange for plastic money (see Figure 3). Consequently, this development may have caused a contraction in transactions and a reduction in aggregate economic activity. As the confidence for the Greek banking sector is steadily restored and the associated risk is reduced, the aforementioned divergence between the willingness of buyers and sellers to make financial transactions with paper money will be reversed.

Figure 3: Paper money (euros) as a store of value

7. Greece’s growth prospects for 2015

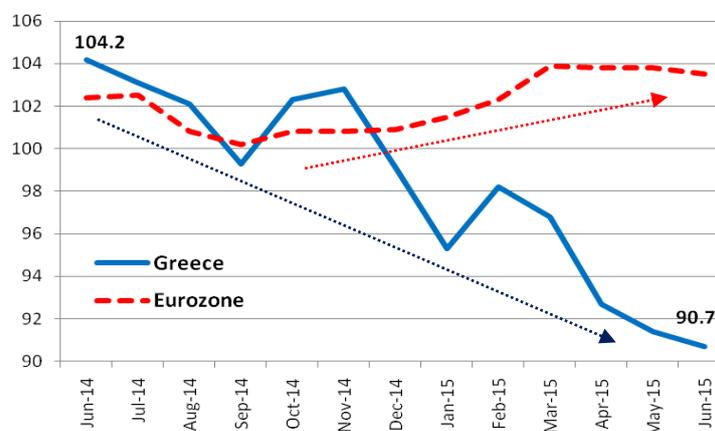

Table 1 presents realizations and official-sector forecasts for Greece’s real GDP growth and components. Furthermore, in the table’s last horizontal panel we present alternative scenarios for the evolution of the respective variables in 2015. Last year, real output grew by 0.77%, the first positive growth reading after six-consecutive years of steep declines. This positive performance was driven by increases in private consumption, investment and exports. Furthermore, the growth carryover for 2015 was positive (to the tune of c. 0.13ppts), while the European Commission’s latest winter

⁸ For more information on the developments in Cyprus please refer to the following:
<http://www.eurobank.gr/Uploads/Reports/Cyprus%20Trip%20JUNE2015.pdf>

July 31, 2015

forecasts (February 2015) predicted Greek real GDP growth for this year to come in at 2.5% i.e., just 0.5ppts lower compared to the country's long-run average growth performance in 1960-2014: 3.04%.

Figure 4: Economic Sentiment (Greece vs. Eurozone)

Source: (a) European Commission, (b) Eurobank Research.

However, this improvement in momentum proved to be transitory. As Figure 4 demonstrates, Greece's economic sentiment index followed a broadly declining path over the last 12 months, after peaking at a six-year high in June 2014. The snap elections of January 25, 2015 along with the prolonged negotiations between Greece and its official lenders boosted domestic uncertainty, with a destabilizing impact on 2015 growth prospects.⁹ Table 1 provides striking facts on these developments. European Commission's spring forecasts revised downwards Greece's 2015 real GDP growth forecast by 1.5ppts. Furthermore, investment growth, i.e., the GDP component with the highest volatility, was downwardly revised by 11.5ppts (from 8.4% to -3.1%). According to the European Commission's preliminary and revised projections (10/7/2015), GDP growth rate is expected to lie within a range of -4% to -2% and -0.5% and -1.75% for 2015 and 2016 respectively.¹⁰ Today, taking into account the latest political and economic developments as well as the imposition of capital controls, there is a broad agreement between economists and policymakers that the Greek economy has already entered a new recessionary phase.

Table 1: Greece's Economic Prospects

Year		Variables (yearly percentage change, %)					
		GDP	Private Consumption	Public Consumption	Investment	Exports	Imports
2014		0.77%	1.35%	-0.89%	2.66%	8.96%	7.41%
		<i>European Commission (Forecasts)</i>					
2015	February	2.5%	1.7%	-0.9%	8.4%	5.6%	4.0%
	May	0.5%	0.6%	-0.6%	-3.1%	4.1%	2.0%
	July (preliminary)	-2% to -4%					

Source: (a) Eurobank Research.

Note: (a) all variables are measured in real terms.

⁹ For the first three quarters of 2014, the qoq%, sa., growth rate of GDP was 0.75%, 0.26% and 0.67% respectively. In the next two quarters this growth path changed. More specifically, for the 4th quarter of 2014 and the 1st quarter of 2015, the qoq%, sa., growth rate was -0.41% and -0.16% respectively.

¹⁰ According to the European Commission's preliminary and revised projections (10/7/2015), GDP growth rate is expected to lie within a range of -4% to -2% and -0.5% and -1.75% for 2015 and 2016 respectively. For more details see:

http://ec.europa.eu/economy_finance/assistance_eu_ms/documents/2015-07-10_greece_art_13_eligibility_assessment_esm_en.pdf

8. Concluding remarks

This report attempts a preliminary analysis of the potential implications of capital controls for domestic economic activity. Their immediate effect was an increase in the transactions distortions (some types of transactions are now forbidden by law, while others are inhibited by high transaction costs) as well as a deterioration of the domestic economic climate due to increased consumer and investor uncertainty. In our view, the duration and intensity of capital controls in Greece will be a function of domestic political developments down the road, the evolution of negotiations on a new bailout arrangement as well as the speed and success in implementing the agreed package of fiscal and, primarily, structural reforms. Near term, we expect capital controls to negatively affect both the demand and the supply side of the Greek economy. On the one hand, increased transaction costs and the deteriorating economic sentiment are expected to have a negative impact on the demand for domestically-produced goods and services. On the other hand, the dependence of many Greek firms (in manufacturing as well as in other sectors) on imports is likely to have a negative supply-side effect. Overall, the current state of affairs in the domestic economy sows the seeds for another recessionary year in 2015.
